

Here at Dyson, we are working hard to assist you and your team on LEEDv4 projects.

Please note the Dyson Airblade dB, V, & Tap are exempt from contributing recycled content and regional content information for LEED, both for previous systems and for LEEDv4. This is due to the high dollar value of mechanical, plumbing, and electrical equipment (MEP) compared to their size relative to other items.

As per the following excerpt below, the Dyson Airblade dB, V, & Tap contribute to other LEED credits, but not the Material and Resource credits for LEEDv4 BD+C, LEEDv4 ID+C. For LEEDv4 O+M it is included in MRc4: Solid Waste Management Ongoing, as noted on the available compatibility charts. LEEDv4 O+M does not require recycled content or regional content for the Dyson Airblade dB, V, & Tap, only weight of units for waste diversion at the end of their useful life.

As per LEEDv4 BD+C & ID+C,
Material and Resources Overview: Qualifying Products & Exclusions

"In past versions of LEED, all mechanical, plumbing, and electrical equipment (MEP), categorized as CSI MasterFormat divisions 11, 21-28, and other specialty divisions, was excluded from MR credits. In this version of LEED some specific products that are part of these systems but are 'passive' (meaning not part of the active portions of the system) may be included in credit calculations."

(The Dyson Airblade dB, V & Tap are all considered an active portion of the system.)

As per LEEDv4 O+M
Material and Resources Overview: Qualifying Products & Exclusions

"Excluded from MR credits are all mechanical, plumbing, and electrical equipment (MEP), specialty items, and products purchased for temporary use on the project."

We invite you to review our LEEDv4 Compatibility Charts for more information.

Thank you,
